PT3™ - PRACTICAL TEST PROCESS IMPROVEMENT

SystemwarePS has established a unique and practical way to improve your testing organization. This improvement process is driven by the PT3™ - The Practical Testing Model that maximizes the power of PEOPLE, PROCESSES and TOOLS to an end-state of enrichment, efficiency and effectiveness. Practical hands-on experiences make up our software testing "industry best practices" which allow organizations to take advantage of lessons learned and practical approaches for testing software. Unleash the power of your testing organization by establishing a practical value-based improvement roadmap steeped in practical "industry best practices".

The scope of the PT3™ - The Practical Testing Model comprehensively includes the following key areas:

Each key area (organized across people, processes and tools) represents practices within a mature software testing organization. Each key area is assessed in comparison to the mature software testing organization in which a maturity rating is established and improvement recommendations are in part determined
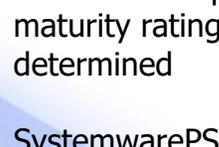

SystemwarePS provides an assessment of a client's test organization with the PT3™ - The Practical Testing Model to interactively determine the current level of organizational maturity for people, processes and tools. A practical roadmap is established for areas where improvements are deemed appropriately aligned with organizational goals. This approach provides the quickest and most effective path to providing real business value to the organization.
